

High quality solution that removes the inconvenience and cost of replacement keys

Strong Security

Each user can enter a code between 4 and 10 digits long.

This code can comprise numbers or letters making the number of potential codes incredibly large. The lock can be set so that a new user can enter a new code for each use or it can be set to have one code that is issued to the person that will use that locker all of the time.

If the code is forgotten an emergency master code can be used to open the door.

Optional Coin Deposit Feature

This optional feature can be used to discourage users from using more than one locker.

The coin can be retained as a payment if the time limit for the locker is exceeded.

Wireless

Long life battery operated with no wires or software.

When the battery life is low the door can only be opened but not closed.
